

JAVA VIVA QUESTIONS

1. features of java

Object oriented,simple,platform independent,robust,multithreaded,distributed,secure ,portable.

2.object oriented concept

object,clsdd,abstraction,encapsulation,polymorphism, inheritance.

3.what is JVM,JRE,JDK.

JVM: java virtual machine.

JRE: java runtime environment.

JDK: java development kit.

4.Java method?

a method is a way to perform some task.

Similarly, the method in Java is a collection of instructions that performs a specific tas

5.what is package?

pakage is the group of similar classes,subclasses and interface.there are two

types of packages .built in packages and user defined packages

6.how we declare a userdefined packages?

using package keyword.

Eg.package package_name

7.what is interface?

interface is a kind of class that contains final variable and abstract method.inherface is declare using interface keyword

eg.interface interface_name

```
{  
.....final variable;  
.....abstract method;  
}
```

8.import statement?

import statement is use to bring certain class or all packages to be visible.

Eg import java.io.*;

Import java.util.*;

9.what is literals?

literals are constant values differen types of literals integer,binary,string,character,real,floating point literals etc.....

10.what is constructor?

constructor is a block of code similar to the method,the name of the method is similar to the class name,it doesnot have a return type.two types of constructor deault and parameterized constructor.

11.what is method overloading?

it is a type of polymorphism,if a class has multiple methods with same name,its is differ from the number of parameters and there datatype.

12.what is ,method overriding?

if a subclass/child class has the same method as declared in the parent class is know as method overriding

13.extends keywords is used to derived a class

14.implements is used to use interface in a class

15.super keyword?

super keyword is used to refer parent class object.it is used to invoke immediately a parent class constructor and method.

16.what final keyword?

final keyword is use to restrict user,final keyword is used in variable,class and method.

final is used in variable : the user can not change the value.

final is used in method: it does not over ride it.

final used in class: it cannot derived it.

17.what is finalize?

finalize is a method ,which is used to perform clean up process before garbage collected.

18.what is finally block?

finally is a block in java exception handling to execute importance code whether the exception is occurs or not

19.what is abstract class and method?

whwn we declare a abstract class it should be inherited. Abstract class is an incomplete class.we cannot create the object directly in the case of an abstract class,create object using subclass.

abstract method: a abstract method can not have body it must override ,you must declare an abstract class in super class/parent class.

20.access specifiers in java.

default,public,private,protected.

21.what is an exception handling?

exeception handling in java is a power mechanism to handle runtime errors such as ArithmeticException,ArrayIndexOutOfBoundsException etc...

try block contains the statement that generate exception

throw .it is used to throw the exception to the catch block which is generated in the try block

catch block is used to handles the exception generates in the try block.

22.what is streams ?

Streams in java is a path along with data flows.

23.what is a thread?

thread is similar to a program that have single flow of control it has a beginning,end and execute sequentially ,all main program called single threaded program.every programs will have atleast one thread.

24. what is multithreading?

a unique property In java ,a program is divided in number of subprograms which can be implemented at the same time in parallel.a program contain multiple flow of control is known as multithreaded programing.

25.what are the ways to create a thread?

using thread class . extends Thread.

using runnable interface

26.what are the thread methods?

start(),stop(),sleep(),run() run method is the heart and soul of thread,etc.....

27.what is applet?

applet is a small java program primarily used in internet programming.They can transport over internet from one computer to another.and run using appletviewer and web browser that support java

28.what are the two types of applet.

local applet : developed locally and stroed in local computer.

remote applet : developed by someone else and stored in remote computer connected in the internet.

29.what is Wrapper class.

wrapper class in java is the mechanism to covert primitive to object and object to primitive autoboxing and unboxing are the two features used for conversion

Autoboxin : primitive to its corresponding wrapper class

Unboxing : wrapper class to its corresponding primitive.

30.what is API?

Application program interface.

31.how will we create an API?

using awt and swing

32.what is awt?

abstract windowing tool kit.

33.what is JDBC?

JDBC stands for java database connectivity ,it a java api used to connect and execute query with the database

34.what is event?

event can be defined as changing the state of object or behaviour by performing actions.actions can be button click,pag scrolling,keypress through keyboard.

35 what is event handling.

event handling is the mechanism to handle event and decide what should happened after the event occurred

java uses delegation model to handle the event

Delegation model has source and listener.

source : event are generated from the source

Listener : listeners are used to handle the event generated from the source.

36.what is inheritance?

it is the process of acquiring the properties and behaviour of one class to another

37.JDBC methods ?

39.how to display the image?

40.how to declare an array?

```
int a[ ] = int [size];
```

41.datatypes

42.String function in java?

length(),toUpperCase(),toLowerCase() etc....
